The surgical technique shown is for illustrative purposes only. The technique(s) actually employed in each case will always depend upon the medical judgment of the surgeon exercised before and during surgery as to the best mode of treatment for each patient. Please see the Instructions For Use for the complete list of indications, warnings, precautions, and other important medical information.

INTRODUCTION

The Forza Implants System has been designed to help optimize Transforminal Lumbar Interbody Fusion (TLIF) and Posterior Lumbar Interbody Fusion (PLIF) procedures with surgeon designed implants and instruments. The Forza Implants System offers implants manufactured from either PEEK, Titanium (Ti), or PEEK Titanium Composite (PTC) materials.

DESIGN ADVANTAGES

Forza™ PEEK	Forza™ PTC	Forza™ Ti
Large center opening for packing bone grafting material		
Bulleted nose to assist with distraction		
Threaded Connection to the implant inserter with rail grooves for a secure hold that is firm enough for an insert and rotate technique	PEEK Core to obtain imaging properties while assessing them	Functional gradient porous structure with 80% porosity at the midline of the implant to allow for increased fluoroscopic visualization
Chamfered edges for easier rotation with the straight cage	3D porous titanium with macro, micro, and nano-scale surface features	The nano-scale surface has been shown to increase proliferation and alkaline phosphatase activity (an early osteogenic differentiation marker) in human stem cells in vitro ¹
	3D-printed titanium endplates with 400 micron pores and 50% porosity are designed to help facilitate bone ingrowth ²	
Aggressive anti-migration ribs for resisting implant migration	The endplates consist of interconnected gyroid structures analogous in form to trabecular bone, which provide an open porous environment	
Vertical tantalum marker 1mm from the edge for clear in-situ implant positioning		

Special features of the Forza Implants and Instruments include:

- One set of instrumentation can be used with Forza PEEK, Ti and PTC implants
- Threaded inserters with rail features for secure connection to the implant
- Implant Inserters with different handle angle locations to match surgeon preference
- MIS Inserter for improved visualization in tight spaces
- Monolithic implant trials for speed and efficiency

STERILIZATION

Forza PEEK, Ti, and PTC Implants are provided in a sterile package. Carefully confirm the implant size that you desire from the outside label prior to opening the box or inside trays. The implants are packaged in a double-tray with a peel back lid for easy transfer into the sterile field. If the implant is opened and not used, the implant MAY NOT be sterilized and used again. Forza instruments are utilized with either the Forza PEEK, Ti, or PTC implants. Forza instruments are provided non sterile and require cleaning and sterilization prior to each use. Clean and sterilize the Forza instruments as directed by the Instructions for Use (IFU). In order to mitigate tears or ripping of the sterile wrapping, please do not drag the sterile cases while wrapped.

¹ In vitro performance may not be representative of clinical performance

² As suggested in an in-vivo lumbar spinal fusion model

1. DISCECTOMY

Remove the disc using Pituitary Rongeurs and Curettes such as those provided in the Forza Discectomy Case with minimal or no nerve root retraction. Both Cup and Ring Curettes are provided in the Forza Discectomy Set. Forza Ring Curettes are designed for linear scraping and not for rotating while in the intervertebral body space.

If there is significant disc space collapse, completion of the discectomy may not be possible until distraction of the disc space takes place.

(Fig. 1a & 1b)

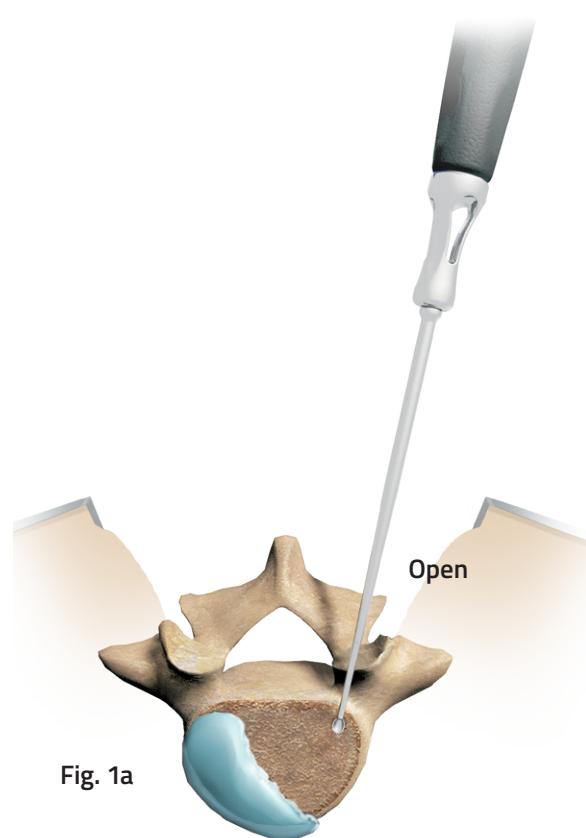

Fig. 1a

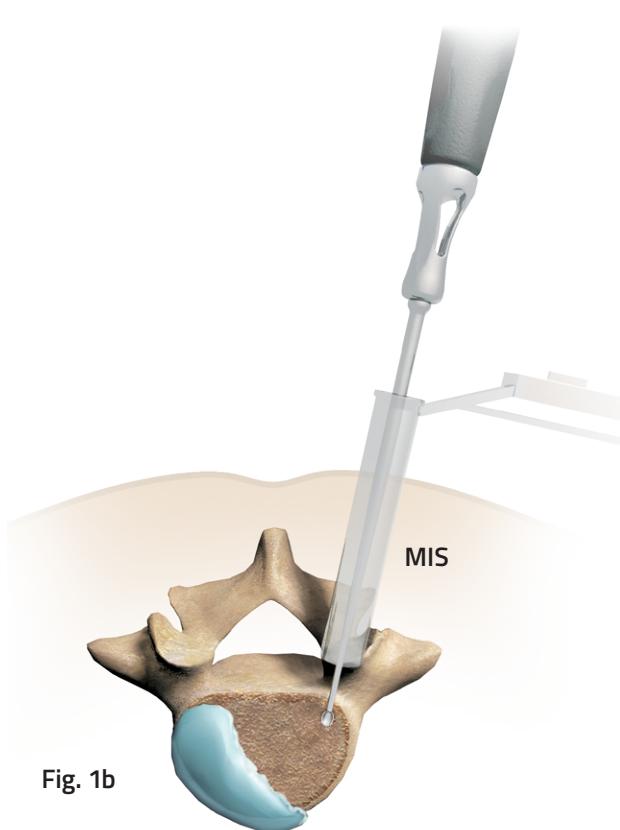

Fig. 1b

2. DISC SPACE PREPARATION

Distract the disc space sequentially using distractors such as the Paddle Distractors provided in the Forza Discectomy Case. The size indicated on the Forza Paddle Distractors matches the height of the Forza Trial and Forza implant. The heights are clearly indicated on the instruments and the shafts are color coded. However, colors are variable, therefore it is imperative to confirm the size with the numbers on the instruments.

NOTE: Although color coding may be a useful tool, colors may vary. It is therefore, imperative to confirm the size with the numbers on the instrument.

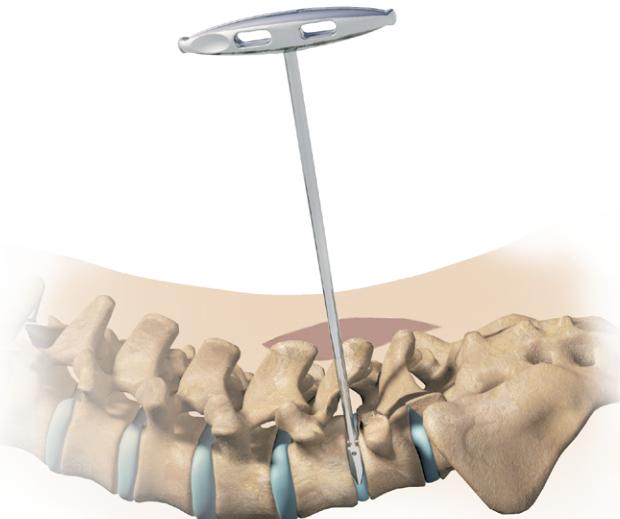

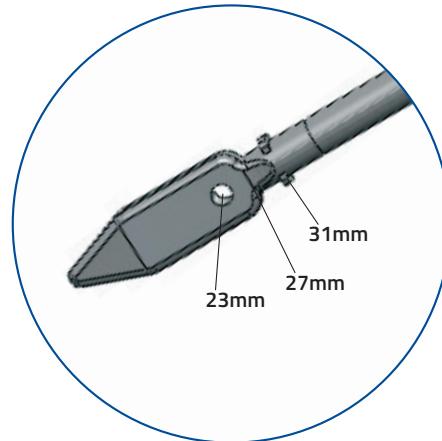

Fig. 2

HEIGHTS	COLORS
6mm	BRONZE
7mm	BLUE
8mm	GREEN
9mm	GOLD
10mm	DARK BLUE
11mm	MAGENTA
12mm	SEAFOAM
13mm	GRAY
14mm	TEAL
15mm	PURPLE
16mm	COPPER OR PINK

The most commonly used lengths associated with the Forza implants are indicated by the circle (23mm), the end of the body (27mm), and the small protrusions on the neck (31mm). Each of these length indicators are visible with fluoroscopy.

Insert the Paddle Distractor with the sides touching the endplates and turn to distract. If necessary, repeat sequentially with additional sizes until desired disc space height and foraminal size is obtained. **(Fig. 2)**

3. DISC SPACE PREPARATION

Rotating Cutters are provided in sequential heights to remove any additional disc and to prepare the endplates. (**Fig. 3**) The Cutters in the Forza Discectomy Set are designed for safety with a blunt tip and cutting sides.

The color coded rotating sleeve is designed for use with two hands for a smooth cutting motion. The three most common Forza Implant lengths, 23mm, 27mm, and 31mm, are indicated on the Rotating Cutters with numbers and bars, and small holes that can be seen by lateral fluoroscopy when the instrument is directly straight such as in a PLIF position. The heights are clearly indicated on the instruments and the rotating sleeves are color coded. As with the Forza Distractors, colors are variable, therefore it is imperative to confirm the size with the numbers on the instrument. See previous page for the height/color chart.

Choices of Rasps, Curettes, and other additional instruments are provided in the Forza Discectomy set for disc removal and end plate preparation.

The Ring Curettes are designed for linear scraping and not for rotating while in the intervertebral body space.

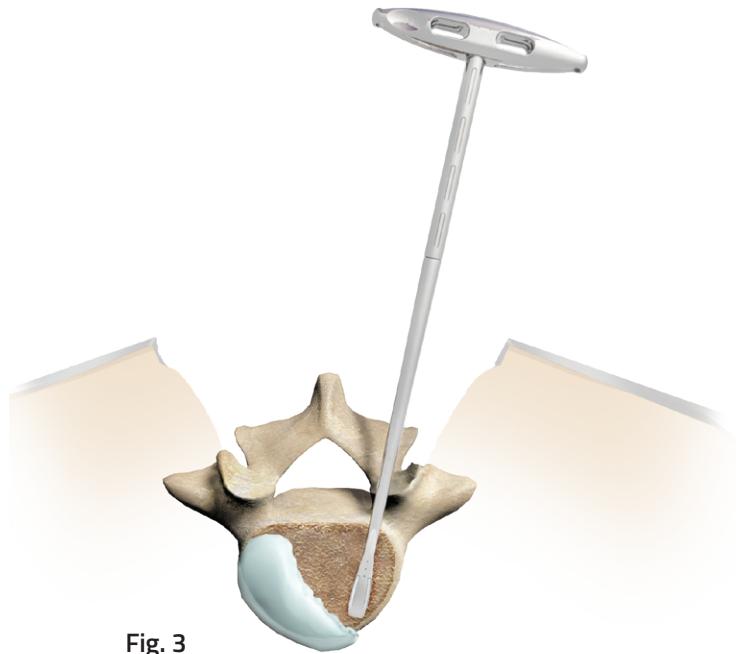

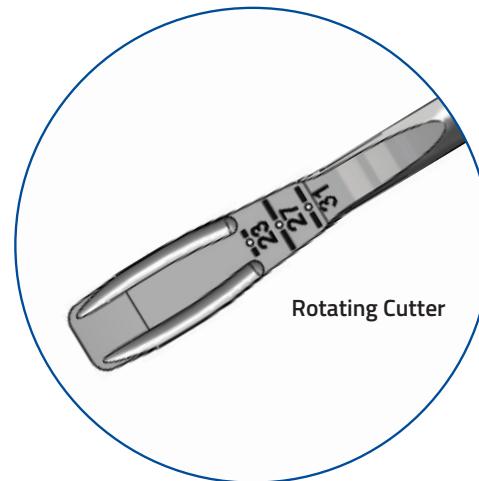

Fig. 3

4. TRIAL SIZING

Forza Trials are 9mm wide and 27mm long with length indicators that are visible with fluoroscopy. The small hole indicates 23mm. The end of the trial body is 27mm. The ring indicates 31mm. Also to assist with implant positioning there are lines on the shaft of the Trials for visual alignment once in situ.

Insert the Forza trials sequentially by height size until the desired disc space height is obtained. Use A/P and lateral fluoroscopy for placement and trajectory. (**Fig. 4**)

A Slap Hammer is provided in the Forza instrument set for assisting with pulling the Forza Trial out of the disc space. Holding the tip of the Trial distally, attach the Slap Hammer to the Trial Handle aligning and sliding the prongs to the slot on the Trial Handle, and turning the Slap Hammer clockwise until it is locked.

Remove the Slap Hammer holding the tip of the Trial distally, pulling the two prongs up, turning the Slap Hammer counterclockwise to unlock, and sliding it off from the Trial.

Once the desired Forza Trial size is determined, match the size with the appropriate Forza implant. The heights of the Forza implants are color coded with a square on the box that contains the sealed tray. These color coded squares correspond to the chart on page 3 and match the Distractors and Rotating Cutters in the Forza Discectomy Set.

NOTE: Although color coding may be a useful tool, as with the colors on the instruments, colors may vary. Please confirm the size on the label.

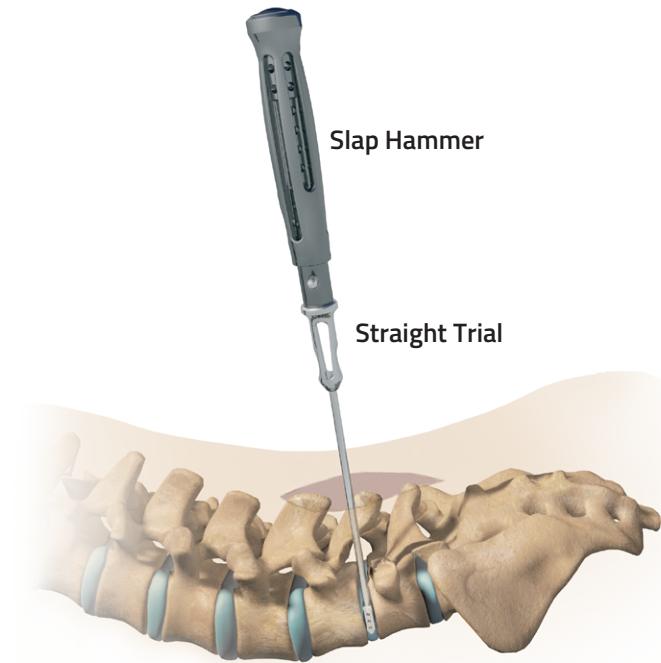

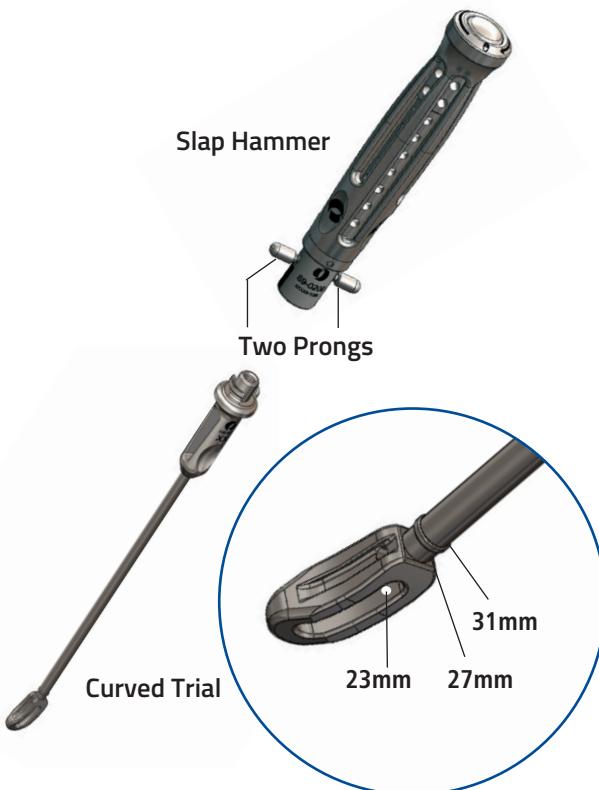

Fig. 4

5. FORZA IMPLANT INSERTION

Modular Implant Inserter

Forza PEEK, Ti, and PTC implants are provided sterile. Choose the desired implants. Carefully check the label for the type and size of the implants, as well as the expiration date to confirm that the package has not expired. If a implants is opened by mistake it cannot be re-sterilized.

Prior to attaching the Modular Implant Inserter to the Forza PEEK, Ti, or PTC implants, add autograft and /or allograft comprised of cancellous and/or corticocancellous bone graft into the implants opening(s) as desired.

The Modular Implant Inserter may require assembly or disassembly prior to use. See page 28 for complete instructions.

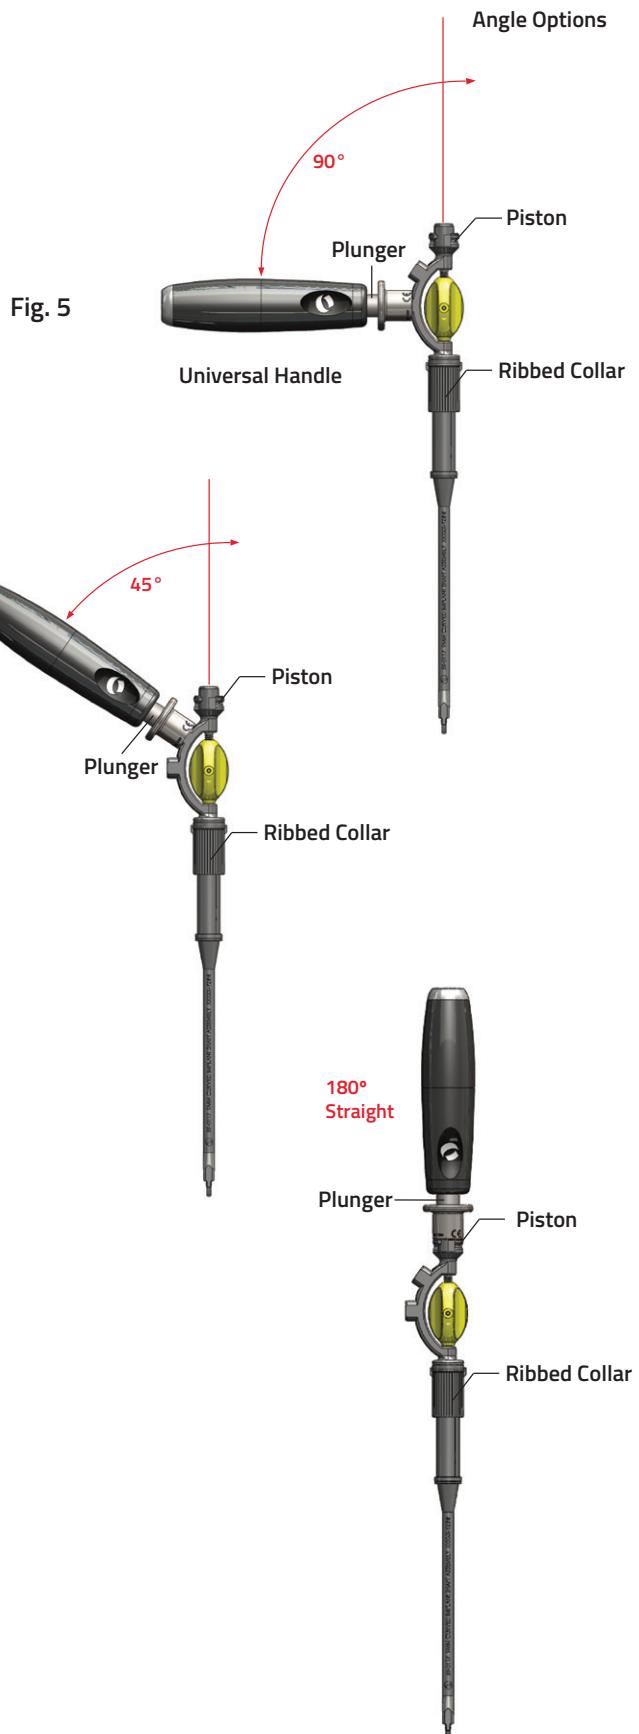

Due to the modularity, options for the Modular Implant Inserter include four (4) different shafts and three (3) handle angle positions. The shafts are for straight and curved implants in 9mm and 11mm widths. The handle angle options are 180°, 90°, and 45°. (**Fig. 5**)

When using the Modular Implant Inserter in the 90° or 45° position there is an option to use the Impact Cap for impacting with a mallet. Holding the Modular Implant Inserter distally, attach the Impact Cap to the Modular Implant Inserter aligning and sliding the prongs to the slot on the Modular Implant Inserter, and turning the Impact Cap clockwise until it is locked.

To remove the Impact Cap hold the tip of the Modular Implant Inserter distally, pull up the two prongs, turn the Impact Cap counter-clockwise, and slide it off of the Modular Implant Inserter.

The Modular Implant Inserter can be used alone or with the Universal Handle. A strike plate is provided on the Universal Handle for impacting with a mallet. To assemble the Handle to the Modular Implant Inserter mate the Handle with the piston or connection. Use two fingers around the metal top of the Handle and push down the plunger like a syringe while turning the Handle clockwise until firmly attached.

Optionally place autograft or allograft comprised of cancellous and/or corticocancellous bone graft anteriorly in the disc space prior to inserting the implant and contralaterally once the implant is inserted.

To place the implant in situ, attach the appropriately sized Forza PEEK, Ti, or PTC implant to the Modular Implant Inserter by aligning the implant grooves with the Modular Implant Inserter rails then turning the center gold knob clockwise until the implant is firmly attached. The rails on the Modular Implant Inserter hold the implants to provide additional stability for the implant connection. The straight implant has grooves on both sides to engage with the Straight Shaft of the Modular Implant Inserter to add stability when rotating.* The curved implant has a longer posterior groove to engage with the corresponding Curved Shaft of the Modular Implant Inserter. This longer groove and rail interface assists with steering the implants in situ.

To disengage the implant, turn the gold knob counter-clockwise until it is disengaged.

If pulling back the implant posteriorly is desired, the Slap Hammer is available in the Forza Instrument Set. To attach the Slap Hammer to the Modular Implant Inserter align and slide the prongs to the slot on the Modular Implant Inserter and turning the Slap Hammer clockwise until it is locked. Please note that the Slap Hammer can only be oriented in the 180° position.

Remove the Slap Hammer by holding the tip of the Modular Implant Inserter distally, pull up the two prongs, turn the Slap Hammer counter-clockwise, and slide it off.

MIS Inserter (Fig. 7)

The MIS Inserter is available for a simple insertion of the curved or straight implants either with an open or a MIS technique. Connection is achieved by firmly attaching the implant to the threaded connection and turning the instrument clockwise 3 full rotations. Over tightening may cause binding of the implant and then difficulty with releasing it when disengaging. When using this instrument, do not lever it nor use heavy force.

To disengage the implant, turn the instrument counter-clockwise until it is disengaged.

Optional Monolithic Straight Implant Inserter

Another option for inserting the straight implant is the Monolithic Straight Implant Inserter. (Fig. 8) This Inserter is designed with a T-Handle attached for easier rotation. Connection to the Forza straight implant is achieved by aligning the implant grooves with the rails on the Inserter, then turning the center knob clockwise. The rails are the same as on the Modular Implant Inserter and serve the same purpose, providing additional stability, particularly with rotation.*

To disengage the straight implant, turn the center knob counter-clockwise until it is disengaged.

***NOTE:** The Forza PEEK straight implants may be rotated after insertion with either the Modular Implant Inserter or the Monolithic Straight Implant Inserter. The Forza PTC and Forza Ti implants are not intended to be rotated after insertion.

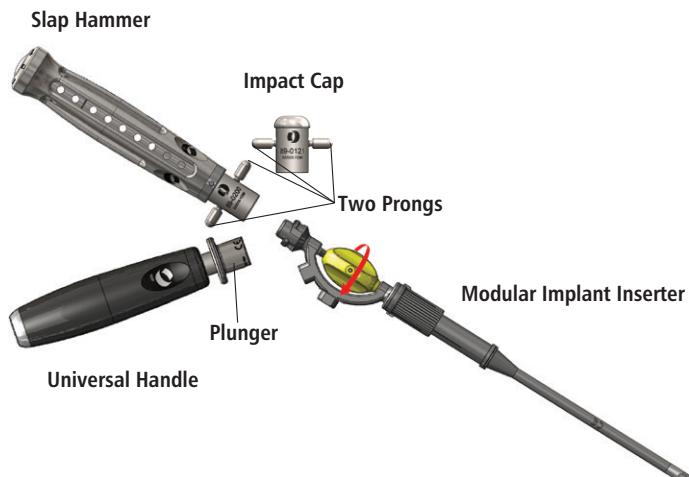

Fig. 6

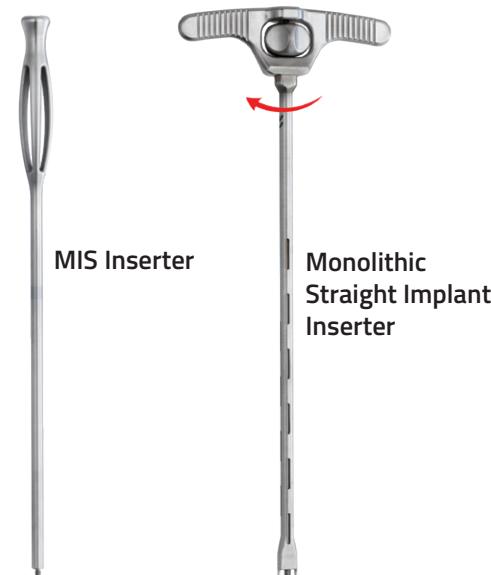

Fig. 7

Fig. 8

5. FORZA IMPLANT INSERTION (CONT.)

Insert the desired Forza PEEK, Ti, or PTC implant into the intervertebral body space with one of the Forza Inserter choices and impact the Inserter with a mallet to initiate positioning. Verify the position of the implant with fluoroscopy. **(Fig. 9a)**

Implant Positioning

Use a Tamp to push the Forza PEEK, Forza Ti or PTC implant into the desired position. **(Fig. 9b)** A variety of Tamps are provided in the Forza Instrument set. **(Fig. 10)**

Straight Forza Tamps are specific to the width of the implant with side rails for added control. To use, align the fork of the Tamp with the implant grooves and impact to push the implant into the desired position. Once implant positioning is completed, pull out the Tamp.

The Corner Tamp is designed to assist with turning the implant. To use, align the grooves of the Corner Tamp with the implant hole or corner edge and impact to push and/or steer the implant.

Fluoroscopy is recommended to confirm positioning. Once positioning is completed, pull out the Tamp.

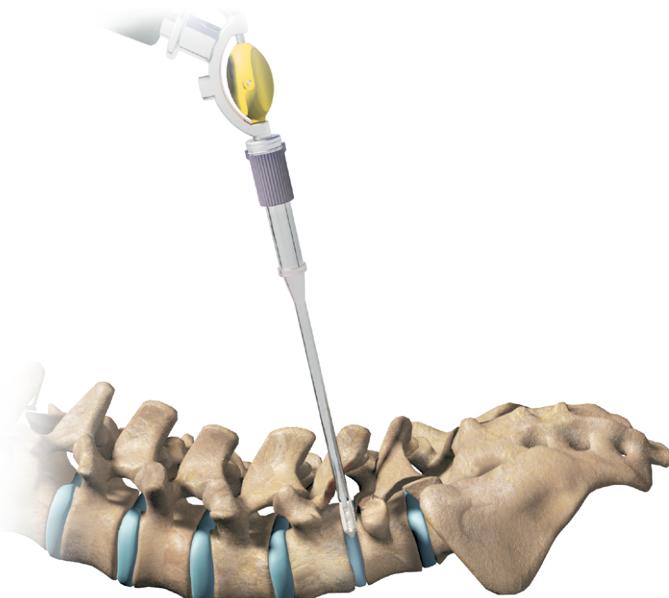

Fig. 9a

Fig. 9b

The optional Articulating Tamp is designed to assist with turning the Forza PEEK, Ti, or PTC Curved Implant in TLIF procedures when not using MIS tube retractors. Prior to sterilizing, be sure to loosen the gears by turning the center knob counter-clockwise and confirming that the gears are separated and loosened.

Please note when using this instrument it is recommended to leave the Forza PEEK, Ti, or PTC implant somewhat proud and slightly protruding posteriorly from the disc space when disengaging the implant inserter. This will effectively allow for visualizing the grooves of the Forza implant for easier alignment.

To use the Articulating Tamp, verify that the gears are loose. If the gears are not loose, turn the center knob counter-clockwise to loosen the gears, then put the distal head of the Tamp into the position desired using your fingers. Firmly turn the center knob clockwise to tighten the gears and confirm that they are tightened. Align the rails of the Articulating Tamp with the grooves of the Forza PEEK, Ti, or PTC Curved Implant in situ and impact the metal strike plate to push the implant. Use fluoroscopy to verify the implant position.

To steer the implant additionally while in situ, loosen the distal gears by turning the center knob counter-clockwise. Then with the gears loosened, move the handle of the Articulating Tamp to the desired angle. Turn the center knob clockwise to tighten the gears firmly. Again confirm the implant position with fluoroscopy.

Repeat until the desired implant position is achieved and confirmed with fluoroscopy. Before removing the Articulating Tamp from the disc space, loosen the gears to avoid the possibility of damaging soft tissues.

Use A/P and lateral fluoroscopy for placement and trajectory. The tantalum fluoroscopy markers are 1mm from the anterior and posterior edge of the Forza PEEK and 1mm from the anterior edge of the Forza PTC implant.

Use supplemental fixation for intervertebral body fusion stability.

7. FORZA IMPLANTS REMOVAL

Straight Implant Remover

Follow these steps for removing the Forza PEEK, PTC or Ti implant.

1. Use fluoroscopy to determine exact implant location.
2. Slide the fork of the Implant Remover into the implant grooves until the nubs engage with a click.
3. Turn the knob to lock the implant.
4. Attach the Slap Hammer by aligning it to the Implant Remover, pulling up the two prongs and sliding it down, then turning it clockwise to lock it. **(Fig. 12a)**
5. Pull up on the sleeve of the Slap Hammer to remove the implant. **(Fig. 12b)**
6. Remove the Slap Hammer by holding the tip of the Straight Implant Remover distally and pull the two prongs up, turning the Slap Hammer counter-clockwise to unlock it, and slide it off from the Straight Implant Remover.
7. To remove the implant, unlock the knob and cam the implant slightly while pulling it away from the Implant Remover.

MODULAR IMPLANT INSERTER: DISASSEMBLY AND ASSEMBLY

There are four (4) parts to the Modular Implant Inserter: 1) the Inserter Shaft, 2) the Instrument Body, 3) the Threaded Insert, and 4) the Universal Handle. (Fig. 1)

Modular Implant Inserter

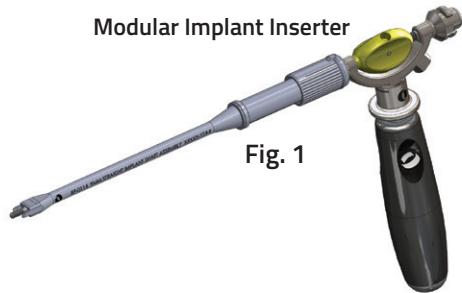

Fig. 1

Disassemble the Modular Implant Inserter using the following steps.

1. Removal of the Universal Handle from the Modular Inserter

- a) Grip the instrument at the gold-colored knob and Inserter Shaft with one hand.
- b) Hold the top of Universal Handle with the other hand like a syringe plunger with your fingers on the sides of the metal top which is proximal to the gold-colored knob.
- c) Using two fingers to push down the metal top plunger like a syringe, turn the Universal Handle counter-clockwise until it separates from the Instrument Body (Fig. 2)

Fig. 2

2. Disassembly of the Inserter Shaft from the Instrument Body

- a) Grip the Instrument Body at the gold-colored knob with the pronged tip of the instrument pointed away from you.
- b) Turn the ribbed collar on the Inserter Shaft, and firmly rotate it clockwise to disengage it from the Instrument Body. (Fig. 3)
- c) Continue rotating the ribbed collar with several rotations until it slides down and stops.
- d) Keep the ribbed collar distal from the Instrument Body and grip the Inserter Shaft with one hand and the Instrument Body with the other hand.
- e) Using caution to not drop the Threaded Insert out of the Inserter Shaft, firmly tug the Inserter Shaft apart from the Instrument Body. (Fig. 4)
- f) Slowly tilt the Inserter Shaft so that the prongs are higher than the ribbed collar to remove the Threaded Insert. (Fig. 5)
- g) If the Threaded Insert did not disengage from the Inserter Shaft with the tilt, gently tap the open port proximal to the ribbed sleeve on the palm of your hand to remove it.

Fig. 3

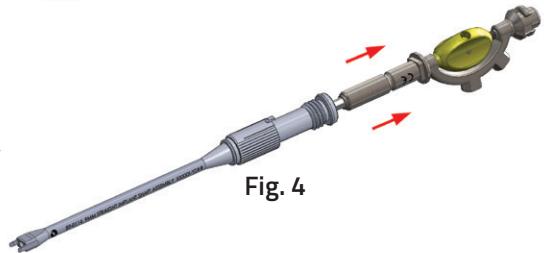

Fig. 4

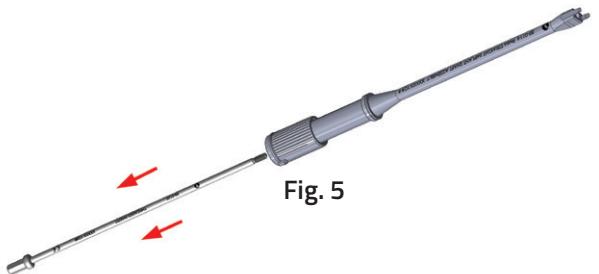

Fig. 5

Assemble the Modular Implant Inserter using the following steps:

1. Hold the Inserter Shaft so that the prongs are pointed toward the floor, and carefully insert the Threaded Insert, threaded tip first, into the open hole proximal to the ribbed collar on the Inserter Shaft. **(Fig. 6)**

a) Confirm that the threaded tip of the Threaded Insert is showing outside of the Inserter Shaft opening.

Fig. 6

2. With one hand gripping the Inserter Shaft and holding the ribbed collar distal to the opening, insert the Instrument Body with the gold-colored knob into the Inserter Shaft. **(Fig. 7)**

3. Turn the Inserter Shaft until the square connection snaps together with the Instrument Body and is fully seated.

a) Confirm that there is no gap between the Instrument Body and the Inserter Shaft.

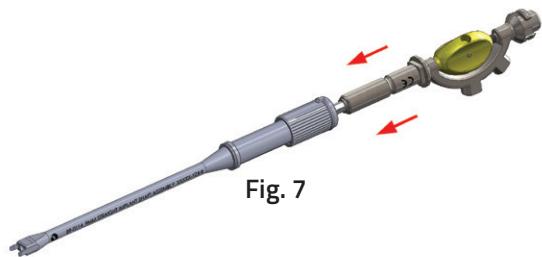

Fig. 7

4. With the Inserter Shaft prongs pointing away from you, rotate the ribbed collar counter-clockwise through several revolutions until the ribbed collar clicks and no gap remains between the ribbed collar on the Inserter Shaft and the Instrument Body. **(Fig. 8)**

a) Confirm that the ribbed collar is firmly engaged with the click and inspect that there is no gap between the ribbed collar and Instrument Body.

Fig. 8

5. Assemble the Universal Handle to the Instrument Body.

a) Hold the metal top plunger like a syringe with your fingers on the sides. **(Fig. 9)**

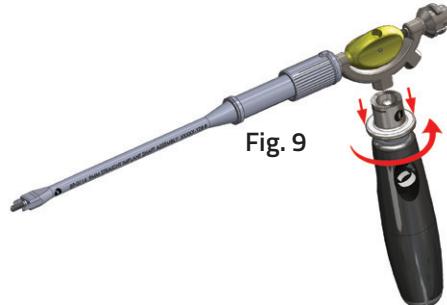

Fig. 9

b) While pulling down on the metal top plunger like a syringe, attach the Universal Handle to the Instrument Body and turn it until it is firmly attached.

Notes

Notes
